Linear and Polynomial Regression

1. Linear and polynomial regression

The dataset TempLinkoping.txt contains daily average temperatures (in degree Celcius) at Malmstätt. Linkoping over the course of the year 2018. The response variable is temp and the covariate is the number of days since the beginning of the year

$$time = \frac{\text{the number of days since beginning of year}}{365}$$

A Bayesian analysis of the following quadratic regression model is to be performed:

$$temp = \beta_0 + \beta_1 \cdot time + \beta_2 \cdot time^2 + \varepsilon, \varepsilon \stackrel{iid}{\sim} N(0, \sigma^2)$$

(a)

(a) Use the conjugate prior for the linear regression model. The prior hyper- parameters μ_0, Ω_0, ν_0 and σ_0^2 shall be set to sensible values. Start with $\mu_0 = (-10, 100, -100)^T$, $\Omega_0 = 0.01 \cdot I_3$, $\nu_0 = 4$ and $\sigma_0^2 = 1$. Check if this prior agrees with your prior opinions by simulating draws from the joint prior of all parameters and for every draw compute the regression curve. This gives a collection of regression curves, one for each draw from the prior. Does the collection of curves look reasonable? If not, change the prior hyperparameters until the collection of regression curves agrees with your beliefs about the regression curve. (Hint: R package mcmc can be used and your Trv v2 simulator from Lab 1.)

adjusting $\mu_0, \Omega_0, \nu_0, \sigma_0^2$

The sarting value results to very high value for temperature(ie. 150°C). This is unreasonal for swedish weather. To achieve better prior we adjust the model parameter as following:

we decided to set the initial value of μ_0 to the `lmTemp$coefficients` we calculated earlier.

$$\mu_0 = (-12, 103, -95)$$

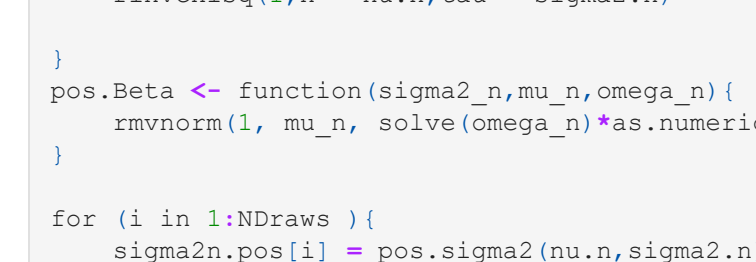

From the above plot we see lots of variation in the models so we decided to reduce the value of σ_0^2 to 0.03. This decision was made by trial and error.

we also increased the value of ν_0 to 10.

```

b)

Write a program that simulates from the joint posterior distribution of $\beta_0, \beta_1, \beta_2$ and σ^2 .

- Plot the marginal posteriors for each parameter as a histogram.
- make a scatter plot of the temperature data and overlay a curve for the posterior median of the regression function $f(time) = \beta_0 + \beta_1 \cdot time + \beta_2 \cdot time^2$, ie the median is computed for every value of time. In addition, overlay curves for the 95% equal tail posterior probability intervals of $f(time)$. ie. the 2.5 and 97.5 posterior percentiles is computed for every value of time. Does the posterior probability intervals contain most of the data points?Should they?

The joint posterior distribution

from Slide

$$\sigma^2 | y \sim \text{Inv} - \chi^2(\nu_n, \sigma_n^2)$$
$$\beta | \sigma^2, y \sim N(\mu_n, \sigma_n^2 \Omega_n^{-1}) \quad (3)$$

new parameters are:

$$\Omega_n = X^T X + \Omega_0$$
$$\mu_n = (X^T X + \Omega_0)^{-1} (X^T X \hat{\beta} + \Omega_0 \mu_0)$$
$$\nu_n = \nu_0 + n$$
$$\sigma_n^2 = \frac{1}{\nu_n} [\nu_0 \sigma_0^2 + (y^T y + \mu_0^T \Omega_0 \mu_0 - \mu_n^T \Omega_n \mu_n)]$$

```
In [23]: X=model.matrix(lmTemp)
y = temp
# setting the initial values
mu.0 <- c(-11, 103, -95)
omega.0 <- 0.01*diag(3)
nu.0 <- 10
sigma2.0 <- 1
n = dim(X)[1]
NDraws = 1000

In [24]: omega.n <- t(X) %*% X + omega.0
nu.n <- nu.0 + n -3
betaHat <- solve(t(X) %*% X %*% t(X) %*% y
mu.n <- solve(t(X) %*% X %*% omega.n %*% t(X) %*% X %*% betaHat + omega.0 %*% mu.0)
sigma2.n <- (nu.0 + sigma2.0 + t(y) %*% y
              t(mu.0) %*% omega.0 %*% mu.0 -
              t(mu.n) %*% omega.n %*% mu.n) / nu.n

In [25]: sigma2n.pos <- numeric(NDraws)
BetaList2n.pos <- matrix(,NDraws,3)
colnames(BetaList2n.pos) <- c("B0","B1","B2")
pos.sigma2 <- function(nu,n,sigma2,n){
  rinvschiq(1,n = nu,n,tau = sigma2,n)
}
pos.Beta <- function(sigma2,n,mu,n,omega,n){
  rmvncrm(1, mu,n, solve(omega.n*as.numeric(sigma2,n))
}
for (i in 1:NDraws) {
  sigma2n.pos[i] <- pos.sigma2(nu,n,sigma2,n)
  BetaList2n.pos[i,] <- pos.Beta(sigma2,n <- sigma2.n,mu,n <- mu.n,omega,n <- omega.n)
}

we now plot the marginal posteriors for each parameter as a histogram. We draws 1000 sample for sigma, and then use these samples to draw beta from (3). The reason to do sampling is because we do not have a closed form for the joint posterior density and we can not obtain marginal density by integration.

In [26]: par(mfrow=c(2,2))
p1 <- hist(BetaList2n.pos[,1],breaks = 20,probability = TRUE,
          xlab = expression(beta[0]),col="khaki1",
